TURBINE PARTS

These are the parts you need to build one Mini Wind Turbine, plus some extras, so you can make your own unique designs.

/ NAME	/QTY	/ PICTURE
Hole Plate SKU 1821-32	1	
Blocks SKU 1821-34	2	
Nuts # 10 Hex SKU 1821-25	1	
Screws 25 mm (1 in) SKU 1821-22	1	E
Mini Hub Screw SKU 1821-66	1	Opportunity
Mini Hub Cover SKU 1821-66	1	Maker Cart Users: These are the
Mini Hub Base	1	Red Hubs, not the Green Hubs.
Motor 1.5V – 3V SKU 1821-75	1	
Motor Mount Small 1.5V – 3V SKU 1821-69	1	
Folder (for blades)	1	
Project Sticks various sizes SKU 1821-17 & 1821-18	12	Stick Sizes 6x 25 cm (10 in) 6x 10 cm (4 in)
Dowels various sizes SKU 1821-20	3	Dowel Sizes 1x 30 cm (12 in) 1x 15 cm (6 in) 1x 5 cm (2 in)

Have a Maker Cart? Use Multi-Cutters to cut your own dowels.

MATERIALS YOU SUPPLY

- Phillips Screwdriver
- Fan
- **Digital Multimeter** (to measure voltage generated)
- 4x Alligator Clip Leads (optional – for connecting Multimeter)
- **2.7 Ω Resistor** (*optional* to smooth voltage readings)
- Tape
- Recycling Materials (to use as turbine blades)

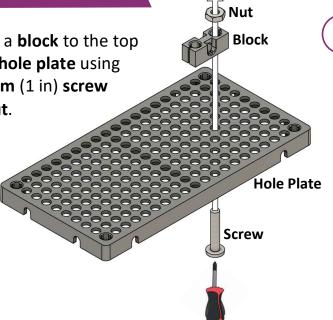

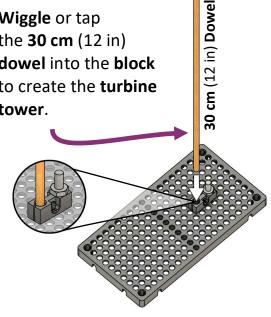

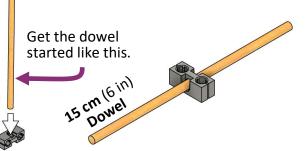

Attach a block to the top of the hole plate using a 25 mm (1 in) screw and nut.

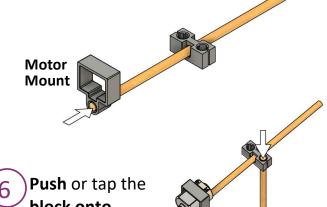

Wiggle or tap the 30 cm (12 in) dowel into the block to create the turbine tower.

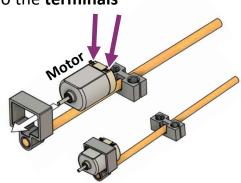

Wiggle or tap the 15 cm (6 in) dowel into the center hole of a block, so it is near the middle.

Push or tap the motor mount onto the end of the dowel.

Wiggle or push the motor into the mount so the terminals face up.

block onto the tower.

Blade Design Lab,

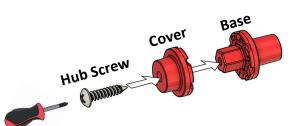

the lab.

don't alter your blades

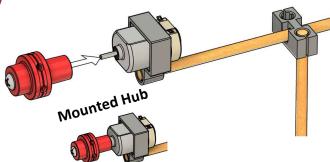

yet! You'll do that in

Add the Rotor

Attach the hub cover to the base with the hub screw.

Push the hub onto the motor axle.

Cut folder into three 22 cm x 5 cm (8.5 in x 2 in) pieces

3x

Tape a project stick to each edge, If you're doing the leaving some extra on one side. 22 cm (8.5 in)

Loosen the mini hub screw just enough to allow the blades to be pushed in.

Add the blades, being sure to angle them (that's what will make them spin).

5 cm

(2 in)

Tighten the hub screw and test it out!

Your turbine is done, but you aren't. Keep reading to learn how to test your turbine, then do a lab or challenge!

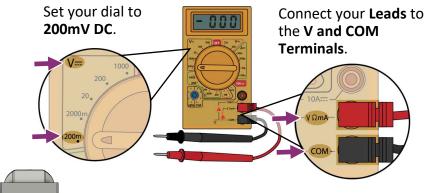

Testing

How well does your turbine work? Hook up a Multi-Meter to find out!

You are going to hook up a Multi-Meter to your turbine to measure the voltage it generates - the faster your blades spin, the greater the voltage will be. More volts means more power!

Connect your meter.

You will connect your meter to the **terminals** of the motor/generator.

There are two ways to connect your meter. Option 1 is a little bit easier to set up, but Option 2 fluctuates less when testing.

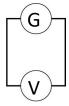

OR

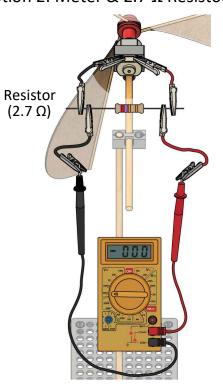

Circuit Diagrams: Can you figure out what the symbols mean?

Option 1

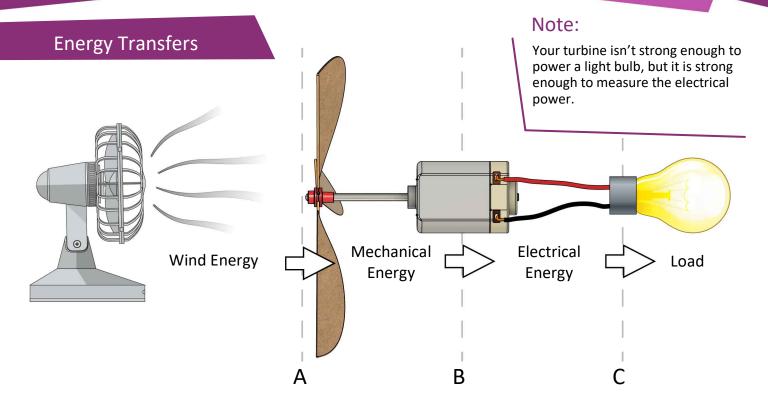

Option 2 2.7 Ω

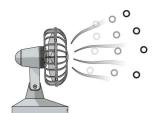

Recommended Option 2: Meter & 2.7 Ω Resistor

A The **Turbine Blades** convert Wind Energy to Mechanical Energy.

Wind Energy is really Kinetic Energy - it's the energy of the moving air molecules.

Mechanical Energy is the Kinetic and Potential Energy of the spinning turbine blades.

B The **Generator** converts Mechanical Energy into Electrical Energy.

When the **Generator** (motor) spins, the wire coils and magnets inside create electricity.

Electrical Energy is the energy of electricity (electrons traveling through the wires).

C The **Light Bulb** uses the Electrical Energy, so it's called the Load.

Loads are anything that uses electrical energy, like your TV, vacuum cleaner, and phone.

Only one of the turbine testing options, from Page 4, has a load. Which one? What's the load?

Voltage Challenge

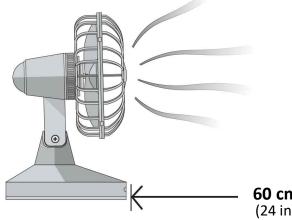

The design that generates the greatest voltage wins!

Constraints:

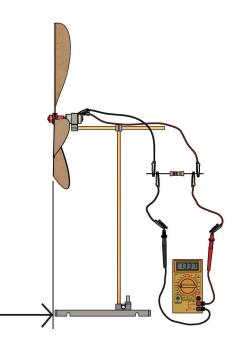

(rules and limits for your design)

Setup:

The fan must be the only power source for your turbine.

Your wind turbine must be at least **60 cm** (24 in) from the **fan**.

All designs must use the same testing circuit.

See Page 5 for testing setup.

Materials:

You may only use the supplies listed on Page 1.

You can use as many recycling bin materials as you want!

You must design your own blades.

You may not use pre-fabricated blades (e.g. from a pinwheel).

Blades must not be dangerous (e.g. metal, sharp edges, etc.).

Additional Challenges

You finished the Voltage Challenge and want more? Try one of these! Use the same setup and material constraints as the Voltage Challenge.

Wind Speed Challenge:

Each competitor does three trials, back-to-back, with different fan speeds (Low, Medium, High). There is a 1 minute adjustment period between trials to swap/adjust the blades for each speed.

The turbine that generates the greatest voltage wins!

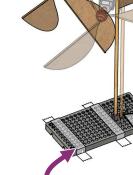

Wind Direction Challenge:

An opponent places your turbine 60 cm (24) in) from the fan, turned whichever way they want. Your turbine needs to use wind power to rotate and turn into the wind.

The turbine that generates the greatest voltage wins!

Weather vanes turn to face the wind - can you make your turbine do it, too?

Design Tips:

Add a vane (blade) to the back of your turbine to make it turn

to face the wind.

Make your block pivot (turn) on the hole plate.

> Dowel pulled up from hole plate.

Screw & nut slightly

Use tape or a weight (e.g. a book) to hold your turbine in place.

Environmental Challenge:

Wind turbines are criticised for looking ugly and killing birds. Modify your turbine to look nice in nature and have safety features to protect birds from the blades.

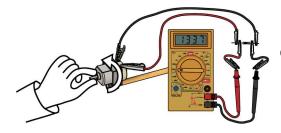

Tuning Your Turbine

Want to generate more voltage? You need to spin the generator fast!

Test it out!

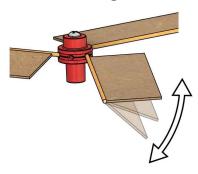

Try spinning the shaft at different speeds in your fingers, and check the reading on the meter.

Resistor Optional

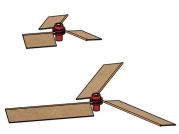

What makes it spin faster?

Blade Angle

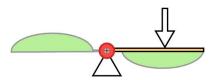

Blade angle is the most important variable, and it's also the easiest to change! Try shallow and deep angles - what works best?

Blade Length

Each blade acts like a lever turning your generator. What works better for speed - long or short blades/levers?

Full size wind turbines use gears to spin the generator quickly, even though the blades move slowly. Gears trade torque for speed, like levers.

Other Variables

Once you figure out how blade length and angle affect your turbine, try changing the shape and number of blades.

Optional Lab

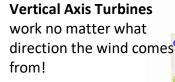

Want to learn more about turbine blade designs?

Download the Blade Design Lab at teachergeek.com/miniwind Ages 8+

Inspiration

Use a shroud to increase the speed of the wind hitting your blades.

Make unique 3D shapes by cutting up plastic bottles and other recyclable materials.

Make a fan by using 1 or 2 AA batteries to power your motor.

Design Evaluate Test Design **Process** Redesign

There is no perfect design. The design process never ends!
